

INTRODUCTION OF DR ROGER AMAR AND FAMI TECHNIQUE

DR Roger Amar is a French Plastic surgeon graduated from Paris and Marseille Universities, (France). DR Roger E. Amar was an assistant professor in same time in Plastic and Reconstructive Surgery and in Anatomy and became an active member of prestigious French, American and Spanish societies for Aesthetic Plastic Surgery.

Dr Amar gave a strong contribution to all fields of plastic surgery with many publications in international journals.

He is working for 20 years at the AMARCLINIC in Marbella using the best cosmetic techniques for the body and face. He is offering his new FAMI technique to replace in most cases the old invasive methods, such as Frontal and face liftings or Lower Blepharoplasty.

FAMI™ is an acronym which stands for Facial Autologous Muscle Injection. (Wikipedia)

FAMI™ procedure is complex. Based on last discoveries in facial anatomy, FAMI™ reshapes the aged facial contours acting as an endo-lift, using our own mesenchymal stem cells from stromal vascular fraction of fat deposits(SVF). Used as a fresh tissue transplant, the injections from the lower part of the body, always younger, are made at the level of the facial bones, muscles and deep fat pads.

Injectable fillers, such as Hyaluronic Acid and the Botox™, nowadays are commonly used for short-term results while regenerative medicine gives a long-lasting solution.

DR Roger Amar has presented his technique all around the world in conferences and surgical meetings and he continues regularly to advocate this concept to young surgeons in international courses and hands-on in anatomical workshops.
